

ASSUMPTION: The COVID-19 vaccines prevent death from COVID-19.

✓ FACT:

CDC data show mass vaccination with the COVID-19 vaccine has had **no measurable impact** on the COVID-19 mortality rate in the U.S.

In the nine months before the introduction of mass vaccination (April 2020 through December 2020), there were about 356,000 COVID-19 deaths or 39,500 deaths per month — a mortality rate of 0.120 per 1,000 people. In the nine months after the introduction of mass vaccination (January 2021 through September 2021), there were 342,000 COVID-19 deaths or 38,000 deaths per month — a mortality rate of 0.115 per 1,000 people. And in the five months that followed (October 2021 through February 2022), there were an additional 249,000 COVID-19 deaths or 49,800 deaths per month — a mortality rate of 0.151 per 1,000 people.

Clinical trials have observed tens of thousands of subjects and are the only studies 1) that included a control group and 2) where all subjects were monitored and tested for COVID-19 regardless of vaccination status. However, those trials did not detect enough COVID-19 deaths to measure a significant difference in mortality between vaccinated and unvaccinated patients.

COVID-19 Pre-Vaccine vs. Post-Vaccine Mortality Rate, United States
